

### **void functions Lab assignment**

- Start with problem #3 from your chapter 5 programs.  
(Interactive program to convert base 10 to binary)
- Change your program to use at least TWO functions besides main:
  1. Function that displays the binary string answer for the argument sent to it.
  2. Function to print any number of lines of any number of characters of any symbol. (This is the printlines function we wrote in class.)
- Include comments that identify: function prototypes, function calls with arguments, function definitions with formal parameters.
- Turn in your source code and sample output.
